Category Theory Conference 2010

Genova, June 25, 2010

The notion of action accessible category (D. Bourn and G. Janelidze, '09)

\mathbb{C} pointed protomodular.

\mathbb{C} pointed protomodular.

Given an object X in \mathbb{C} , consider $\text{SplExt}_{\mathbb{C}}(X)$:

\mathbb{C} pointed protomodular.

Given an object X in \mathbb{C} , consider $\text{SplExt}_{\mathbb{C}}(X)$:

- Objects:

$$X \xrightarrow{x} A \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} B$$

with $ps = 1_B$ and $x = \ker(p)$

\mathbb{C} pointed protomodular.

Given an object X in \mathbb{C} , consider $\text{SplExt}_{\mathbb{C}}(X)$:

- Objects:

$$X \xrightarrow{x} A \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} B$$

with $ps = 1_B$ and $x = \ker(p)$

- Arrows:

$$\begin{array}{ccccc} X & \xrightarrow{x} & A & \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} & B \\ \parallel & & \downarrow f & \lrcorner & \downarrow g \\ X & \xrightarrow{k} & C & \begin{array}{c} \xrightarrow{q} \\ \xleftarrow{t} \end{array} & D \end{array}$$

with $fx = k$, $fs = tg$ and $qf = gp$.

Definition

An object in $\text{SplExt}_{\mathbb{C}}(X)$ is said to be **faithful** if any object in $\text{SplExt}_{\mathbb{C}}(X)$ admits at most one morphism into it.

Definition

An object in $\text{SplExt}_{\mathbb{C}}(X)$ is said to be **faithful** if any object in $\text{SplExt}_{\mathbb{C}}(X)$ admits at most one morphism into it.

$$X \xrightarrow{k} C \begin{array}{c} \xrightarrow{q} \\ \xleftarrow{t} \end{array} D \quad \text{faithful}$$

Definition

An object in $\text{SplExt}_{\mathbb{C}}(X)$ is said to be **faithful** if any object in $\text{SplExt}_{\mathbb{C}}(X)$ admits at most one morphism into it.

$$\begin{array}{ccccc} X & \xrightarrow{x} & A & \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} & B \\ \parallel & & & & \\ X & \xrightarrow{k} & C & \begin{array}{c} \xrightarrow{q} \\ \xleftarrow{t} \end{array} & D \end{array}$$

faithful

Definition

An object in $\text{SplExt}_{\mathbb{C}}(X)$ is said to be **faithful** if any object in $\text{SplExt}_{\mathbb{C}}(X)$ admits at most one morphism into it.

$$\begin{array}{ccccc}
 X & \xrightarrow{x} & A & \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} & B \\
 \parallel & & \vdots & & \vdots \\
 X & \xrightarrow{k} & C & \begin{array}{c} \xrightarrow{q} \\ \xleftarrow{t} \end{array} & D
 \end{array}$$

at most one

faithful

Definition (D. Bourn and G. Janelidze)

Let \mathbb{C} be a pointed protomodular category. \mathbb{C} is said to be **action accessible** if, for any $X \in \mathbb{C}$, every object in $\text{SplExt}_{\mathbb{C}}(X)$ admits a morphism into a faithful one.

Definition (D. Bourn and G. Janelidze)

Let \mathbb{C} be a pointed protomodular category. \mathbb{C} is said to be **action accessible** if, for any $X \in \mathbb{C}$, every object in $\text{SplExt}_{\mathbb{C}}(X)$ admits a morphism into a faithful one.

$$X \xrightarrow{x} A \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} B$$

Definition (D. Bourn and G. Janelidze)

Let \mathbb{C} be a pointed protomodular category. \mathbb{C} is said to be **action accessible** if, for any $X \in \mathbb{C}$, every object in $\text{SplExt}_{\mathbb{C}}(X)$ admits a morphism into a faithful one.

$$\begin{array}{ccccc}
 X & \xrightarrow{x} & A & \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} & B \\
 \parallel & & \downarrow & & \downarrow \exists \\
 X & \xrightarrow{k} & C & \begin{array}{c} \xrightarrow{q} \\ \xleftarrow{t} \end{array} & D
 \end{array}$$

faithful

Examples of action accessible categories:

Examples of action accessible categories:

- Action representative categories, such as groups and Lie algebras;

Examples of action accessible categories:

- Action representative categories, such as groups and Lie algebras;
- Rings (D. Bourn and G. Janelidze);

Examples of action accessible categories:

- Action representative categories, such as groups and Lie algebras;
- Rings (D. Bourn and G. Janelidze);
- Categories of interest in the sense of Orzech (A. Montoli), such as Leibniz algebras, Poisson algebras etc.

Consequences of action accessibility:

Consequences of action accessibility:

$$X \xrightarrow{x} A \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} B$$

Consequences of action accessibility:

$$\begin{array}{ccccc}
 X & \xrightarrow{x} & A & \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} & B \\
 \parallel & & \downarrow f & & \downarrow g \\
 X & \xrightarrow{k} & C & \begin{array}{c} \xrightarrow{q} \\ \xleftarrow{t} \end{array} & D
 \end{array}$$

faithful

Consequences of action accessibility:

$$\begin{array}{ccccc}
 X & \xrightarrow{x} & A & \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} & B \\
 \parallel & & \downarrow f & & \downarrow g \\
 X & \xrightarrow{k} & C & \begin{array}{c} \xrightarrow{q} \\ \xleftarrow{t} \end{array} & D
 \end{array}$$

faithful

Proposition

The kernel of g is the **centralizer** $Z(X, B)$ of X in B , that is, the largest subobject of B that commutes with X in A

Consequences of action accessibility:

$$\begin{array}{ccccc}
 X & \xrightarrow{x} & A & \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} & B \\
 \parallel & & \downarrow f & & \downarrow g \\
 X & \xrightarrow{k} & C & \begin{array}{c} \xrightarrow{q} \\ \xleftarrow{t} \end{array} & D
 \end{array}$$

faithful

Proposition

The kernel of g is the **centralizer** $Z(X, B)$ of X in B , that is, the largest subobject of B that commutes with X in A

Faithful split extensions are easily characterized:

Consequences of action accessibility:

$$\begin{array}{ccccc}
 X & \xrightarrow{x} & A & \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} & B \\
 \parallel & & \downarrow f & & \downarrow g \\
 X & \xrightarrow{k} & C & \begin{array}{c} \xrightarrow{q} \\ \xleftarrow{t} \end{array} & D
 \end{array}$$

faithful

Proposition

The kernel of g is the **centralizer** $Z(X, B)$ of X in B , that is, the largest subobject of B that commutes with X in A

Faithful split extensions are easily characterized:

$$X \xrightarrow{x} A \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} B \quad \text{is faithful} \iff Z(X, B) = 0$$

Proposition

Let \mathbb{C} be a homological category. Then \mathbb{C} is action accessible if and only if:

Proposition

Let \mathbb{C} be a homological category. Then \mathbb{C} is action accessible if and only if:

- 1 for every split extension in \mathbb{C} :

$$X \xrightarrow{x} A \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} B$$

there exists the centralizer $Z(X, B)$ and it is a normal subobject of A ;

Proposition

Let \mathbb{C} be a homological category. Then \mathbb{C} is action accessible if and only if:

- 1 for every split extension in \mathbb{C} :

$$X \xrightarrow{x} A \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} B$$

there exists the centralizer $Z(X, B)$ and it is a normal subobject of A ;

- 2 a split extension in \mathbb{C} is faithful if and only if its centralizer is the zero object.

Counterexamples:

Counterexamples:

- Jordan algebras
because centralizers do not always exist;

Counterexamples:

- Jordan algebras
because centralizers do not always exist;
- Weak versions of rings
because centralizers are not always normal;

If moreover \mathbb{C} is regular (then homological):

If moreover \mathbb{C} is regular (then homological):
For any equivalence relation (R, r_0, r_1, s_0) on an object A , consider
the associated split extension:

If moreover \mathbb{C} is regular (then homological):
For any equivalence relation (R, r_0, r_1, s_0) on an object A , consider the associated split extension:

$$X \xrightarrow{\ker(r_0)} R \begin{array}{c} \xrightarrow{r_0} \\ \xleftarrow{s_0} \end{array} B$$

If moreover \mathbb{C} is regular (then homological):

For any equivalence relation (R, r_0, r_1, s_0) on an object A , consider the associated split extension:

$$\begin{array}{ccccc} X & \xrightarrow{\ker(r_0)} & R & \begin{array}{c} \xrightarrow{r_0} \\ \xleftarrow{s_0} \end{array} & A \\ \parallel & & \downarrow f & & \downarrow g \\ X & \xrightarrow{k} & C & \begin{array}{c} \xrightarrow{q} \\ \xleftarrow{t} \end{array} & D \end{array} \quad \text{faithful}$$

If moreover \mathbb{C} is regular (then homological):

For any equivalence relation (R, r_0, r_1, s_0) on an object A , consider the associated split extension:

$$\begin{array}{ccccc}
 X & \xrightarrow{\ker(r_0)} & R & \begin{array}{c} \xrightarrow{r_0} \\ \xleftarrow{s_0} \end{array} & A \\
 \parallel & & \downarrow f & & \downarrow g \\
 X & \xrightarrow{k} & C & \begin{array}{c} \xrightarrow{q} \\ \xleftarrow{t} \end{array} & D
 \end{array}$$

faithful

Theorem (D. Bourn and G. Janelidze)

The kernel pair of g is the **centralizer** of R , that is, the largest equivalence relation on A that commutes with R

Definition (M.C. Pedicchio)

Let R and S be equivalence relations on A . We'll say that $[R, S] = 0$ if and only if there exists a C , equivalence relation on both R and S , such that, in the diagram below, the four squares where parallel arrows have the same index are pullbacks:

$$\begin{array}{ccc} C & \xrightarrow{p_0} & S \\ \downarrow d_1 & \searrow p_1 & \downarrow v_1 \\ R & \xrightarrow{r_0} & A \\ & \searrow r_1 & \\ & & \downarrow v_0 \end{array}$$

Non symmetric commutativity and ns-centralizers of equivalence relations

Definition (non symmetric)

Let S be a relation on A and R an equivalence relation on A . We'll say that $]S, R] = 0$ if and only if there exists (C, p_0, p_1, t_0) equivalence relation on S with (C, d_0, d_1) relation on R such that

- In the diagram below, the four squares where parallel arrows have the same index are pullbacks:

$$\begin{array}{ccc}
 C & \begin{array}{c} \xrightarrow{p_0} \\ \xleftarrow{p_1} \end{array} & S \\
 \begin{array}{c} \downarrow d_1 \\ \downarrow d_0 \end{array} & \begin{array}{c} \downarrow v_1 \\ \downarrow v_0 \end{array} & \\
 R & \begin{array}{c} \xrightarrow{r_0} \\ \xleftarrow{r_1} \end{array} & A
 \end{array}$$

- If $k : X \rightarrow C$ is a kernel of p_0 (or p_1 equivalently), then $d_0 k = d_1 k$.

Proposition

Let R and S be equivalence relations on A , then:

$$[S, R] = 0 \iff]S, R] = 0$$

Definition

Given an equivalence relation R on an object A . A **ns-centralizer** for R is an equivalence relation $E_A(R)$ on A such that:

- 1 $[E_A(R), R] = 0$
- 2 $E_A(R)$ contains any relation S on A with $]S, R] = 0$

Definition

Given an equivalence relation R on an object A . A **ns-centralizer** for R is an equivalence relation $E_A(R)$ on A such that:

- 1 $[E_A(R), R] = 0$
- 2 $E_A(R)$ contains any relation S on A with $]S, R] = 0$

Proposition

Let \mathbb{C} be a homological action accessible category. Then \mathbb{C} has ns-centralizers for equivalence relations.

A characterization of action accessible categories

$$X \xrightarrow{x} A \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} B$$

$$X \xrightarrow{x} A \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} B$$

Consider the kernel pair $R[p]$ of p .

$$X \xrightarrow{x} A \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} B$$

Consider the kernel pair $R[p]$ of p .

Assume that $R[p]$ has ns-centralizer $E_A(R[p])$, with associated normal subobject Z_A .

$$X \xrightarrow{x} A \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} B$$

Consider the kernel pair $R[p]$ of p .

Assume that $R[p]$ has ns-centralizer $E_A(R[p])$, with associated normal subobject Z_A .

Define:

$$\begin{array}{ccc} E_B & \longrightarrow & E_A \\ \langle v_0, v_1 \rangle \downarrow & \lrcorner & \downarrow \langle z_0, z_1 \rangle \\ B \times B & \xrightarrow{s \times s} & A \times A \end{array}$$

and:

$$X \xrightarrow{x} A \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} B$$

Consider the kernel pair $R[p]$ of p .

Assume that $R[p]$ has ns-centralizer $E_A(R[p])$, with associated normal subobject Z_A .

Define:

$$\begin{array}{ccc} E_B & \longrightarrow & E_A \\ \langle v_0, v_1 \rangle \downarrow & \lrcorner & \downarrow \langle z_0, z_1 \rangle \\ B \times B & \xrightarrow{s \times s} & A \times A \end{array}$$

and:

$$\begin{array}{ccc} Z_B & \longrightarrow & Z_A \\ z_B \downarrow & \lrcorner & \downarrow z_A \\ B & \xrightarrow{s} & A \end{array}$$

Proposition

Let \mathbb{C} be a homological category with ns-centralizers for equivalence relations. The following are equivalent:

Proposition

Let \mathbb{C} be a homological category with ns-centralizers for equivalence relations. The following are equivalent:

① $X \xrightarrow{x} A \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} B$ is faithful

Proposition

Let \mathbb{C} be a homological category with ns-centralizers for equivalence relations. The following are equivalent:

- 1 $X \xrightarrow{x} A \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} B$ is faithful
- 2 $E_B = \Delta_B$

Proposition

Let \mathbb{C} be a homological category with ns-centralizers for equivalence relations. The following are equivalent:

- 1 $X \xrightarrow{x} A \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} B$ is faithful
- 2 $E_B = \Delta_B$
- 3 $Z_B = 0$

Sketch of the proof:

Sketch of the proof:

Suppose $Z_B \neq 0$, then:

Sketch of the proof:

Suppose $Z_B \neq 0$, then:

$$\begin{array}{ccccc}
 X & \xrightarrow{\langle 1,0 \rangle} & X \times Z_B & \begin{array}{c} \xrightarrow{\pi_{Z_B}} \\ \xleftarrow{\langle 0,1 \rangle} \end{array} & Z_B \\
 \parallel & & \downarrow \varphi & \downarrow \times \pi_X & \downarrow j \\
 X & \xrightarrow{x} & A & \begin{array}{c} \xrightarrow{p} \\ \xleftarrow{s} \end{array} & B \\
